p63 is a tumor suppressor protein that is very similar to p53 in structure and function, while being homologous to p73. p63 is important in development and differentiation, and has been identified as a useful marker for distinguishing between lung squamous cell carcinomas and adenocarcinomas. Anti-p63 is also used to differentiate between benign and malignant prostate and breast lesions, due to its labeling of the nuclei of myoepithelial cells in both tissue types.

Features

- GeneAb p63 antibody produces specific nuclear staining with no nonspecific cytoplasmic staining observed.
- Both concentrate (1:100 - 1:200) and predilute (RTU) format are available for your lab
- Unbelievable price starting at $140 USD
